Some (by no means all) things which must be done

to close down a disk system user process:

1) Destroy all subtrees of objects rooted in
temporary directory (Can't destroy temporary
directory yet.)

2) Close all open files.(Overpower the   (DF:CAOF)
doorstop bit.)

3) Fund process ECS charges from:

    a) Master Directory (Swapped ECS) (DA:FUND)

    b) Master allocation block (Fixed ECS) (DF:FUND)

4) Move all reserved ECS and Disk space out. (DA:MVSP)
Set charge rates to zero.   (DA:INCR)

5) Read final charges from charge meters and (DA:DSPA)
decrement to zero.   (DA:INCM)

6) Destroy temporary directory.

7) Call disk system for final cleanup (DF:CLUP)

8) Return to builder to suicide the process.
